Report on a bilateral comparison in the gauge pressure range of $0,7 \mathrm{MPa}$ to 7 MPa . between LNE and

# KIM-LIPI <br> Euramet project 1330 

P. Otal ${ }^{1}$, Rudi Angggoro ${ }^{2}$

#### Abstract

LNE and KIM-LIPI compared their pressure standards in the gauge pressure range of $0,7 \mathrm{MPa}$ to 7 MPa. The results of the comparison can be considered as satisfactory as all the deviations from the reference values are inside the estimated combined uncertainties with a coverage factor $k=2$. LNE was the pilot laboratory of the comparison.

## 1. Introduction

This comparison is a part of the EURAMET project n${ }^{\circ} 1330$. The present report describes the results obtained by the participants. The transfer standard was a pressure monitor type RPM4 A7M from DHInstruments, Inc. serial No. 684, operating with nitrogen with a resolution of 1 Pa .
The nominal pressure points for the comparison were $0 \mathrm{hP} ; 0,7 \mathrm{MPa} ; 1,4 \mathrm{MPa} ; 2,1 \mathrm{MPa} ; 2,8 \mathrm{MPa}$; $3,5 \mathrm{MPa} ; 4,2 \mathrm{MPa} ; 4,9 \mathrm{MPa} ; 5,6 \mathrm{MPa}$; $6,3 \mathrm{MPa}$ and 7 MPa .
The results of the present comparison can be compared to those of the key comparison CCM.P-K1.C

## 2. Participants

The participating institutes are presented in table 1. The comparison took place from August 2014 to October 2014.

Table 1. Comparison participants

| Institute | Measurement date | Person responsible <br> for the intercomparison |
| :---: | :---: | :---: |
| KIM-LIPI | $26 / 08 / 204$ | Rudi Anggoro |
| Laboratoire National d' Essais | $03 / 09 / 2014$ <br> $30 / 09 / 2014$ | Pierre Otal |
| KIM-LIPI | $16 / 10 / 2014$ | Rudi Anggoro |

[^0]
## 3. Laboratory standards

KIM-LIPI and LNE pressure standards are PG 7601 type pressure balance manufactured by DH Instruments. Both standards were equipped with DH Instruments $0,5 \mathrm{~cm}^{2}$ effective area piston-cylinder assemblies made of tungsten carbide.

It was recommended that each laboratory should use a data sheet reporting the data obtained at each comparison point. The measurements were performed for three cycles. The laboratories were also required to report the standard uncertainty of the deviation.

### 3.1 KIM-LiPi pressure standard

The details of the KIM-LIPI pressure standard are listed in tables 2.
Table 2. KIM-LIPI pressure standard and measurement conditions

| Manufacturer \& Model | DH Instruments \& PG 7601- <br> AMH |
| :--- | :--- |
| Measurement range in MPa | $(0.35-7) \mathrm{MPa}$ |
| Material of piston | Tungsten Carbide |
| Material of cylinder | Tungsten Carbide |
| Reference temperature $\left(t_{0}\right)$ in ${ }^{\circ} \mathrm{C}$ | 20 |
| Zero-pressure effective area $\left(A_{0}\right)$ at reference temperature in $\mathrm{mm}^{2}$ | 49.01695 |
| Relative standard uncertainty of $A_{0}$ in $10^{-6}$ | 18 |
| Pressure distortion coefficient $(\lambda)$ in $\mathrm{MPa}^{-1}$ | $-2.35 \times 10^{-6}$ |
| Uncertainty of $\lambda$ in MPa ${ }^{-1}$ | $1.0 \times 10^{-6}$ |
| Linear thermal expansion coefficient of piston $\left(\alpha_{\mathrm{p}}\right)$ in ${ }^{\circ} \mathrm{C}^{-1}$ | $4.55 \times 10^{-6}$ |
| Linear thermal expansion coefficient of cylinder $\left(\alpha_{\mathrm{c}}\right)$ in ${ }^{\circ} \mathrm{C}^{-1}$ | $4.55 \times 10^{-6}$ |
| Local acceleration due to gravity $(g)$ in $\mathrm{m}^{2} \mathrm{~s}^{2}$ | 9.781379 |
| Relative uncertainty of $g$ in $10^{-6}$ | 5 |
| Height difference between laboratory standard $(\mathrm{LS})$ and $\mathrm{TS}(h$, <br> positive if LS is higher than TS) in mm | 0.0 |
| Uncertainty of $h$ in mm | 5 |
| Operating gas (N2) | Yes |
| Piston rotation speed during measurement in rpm | $30 \sim 50$ rpm |
| Room Temperature during measurement in ${ }^{\circ} \mathrm{C}$ | $(18 \text { to } 22)^{\circ} \mathrm{C}$ with stability $1^{\circ} \mathrm{C}$ |
| Traceability | PTB 2007 and 2013 |

The Pressure Balance Standard was bought in 2007 and is traceable to PTB-Germany ( 2007 and 2013).

The expanded uncertainty of the pressure measured by the balance in the conditions of calibration at KIM-LIPI is :

## $\mathrm{U}(\mathrm{p})_{\text {кıIM-LIPI }}=2,4 \mathrm{~Pa}+1,710^{-5} \mathrm{xp}+2.1 \times 10^{-13} \mathrm{xp}^{2}$

## 3.2

 LNE Pressure standardThe details of the LNE pressure standard are listed in tables 3 .
Table 3. LNE pressure standard and measurement conditions

| Manufacturer \& Model | DH Instruments \& PG 7601-AMH |
| :---: | :---: |
| Measurement range in MPa | ( $0.35-7) \mathrm{MPa}$ |
| Material of piston ( ${ }^{\circ} 1051$ ) | Tungsten Carbide |
| Material of cylinder ( ${ }^{\circ} 1051$ ) | Tungsten Carbide |
| Reference temperature ( $t_{0}$ ) in ${ }^{\circ} \mathrm{C}$ | 20 |
| Zero-pressure effective area ( $A_{0}$ ) at reference temperature in $\mathrm{mm}^{2}$ | 49.01872 |
| Relative standard uncertainty of $A_{0}$ in $10^{-6}$ | 5.5 |
| Pressure distortion coefficient ( $\lambda$ ) in $\mathrm{MPa}^{-1}$ | $-2.35 \times 10^{-6}$ |
| Standard uncertainty of $\lambda$ in $\mathrm{MPa}^{-1}$ | $1.2 \times 10^{-7}$ |
| Linear thermal expansion coefficient of piston ( $\alpha_{\mathrm{p}}$ ) in ${ }^{\circ} \mathrm{C}^{-1}$ | $4.55 \times 10^{-6}$ |
| Linear thermal expansion coefficient of cylinder ( $\alpha_{c}$ ) in ${ }^{\circ} \mathrm{C}{ }^{-1}$ | $4.55 \times 10^{-6}$ |
| Local acceleration due to gravity ( g ) in $\mathrm{m} / \mathrm{s}^{2}$ | 9.809273 |
| Relative standard uncertainty of $g$ in $10^{-6}$ | 0,1 |
| Height difference between laboratory standard (LS) and TS ( $h$, positive if LS is higher than TS) in mm | 0.0 |
| Standard uncertainty of $h$ in mm | 1 |
| Operating gas ( $\mathrm{N}_{2}$ ) | Yes |
| Piston rotation speed during measurement in rpm | 20~40 rpm |
| Room Temperature during measurement in ${ }^{\circ} \mathrm{C}$ | $20^{\circ} \mathrm{C}$ with stability $0,5^{\circ} \mathrm{C}$ |
| Traceability | Traceable to primary pistoncylinder assembly |

The effective area $\left(A_{p}\right)$ of the piston-cylinder assembly $n^{\circ} 1051$ is traceable to the primary pistoncylinder assembly DH 6594 whose zero-pressure effective area ( $A_{0}$ ) is based on dimensional measurements.
The measurements were carried out in an air-conditioned room with the temperature maintained between 19.5 and $20.1^{\circ} \mathrm{C}$ during all measurements.
The measurements were performed with the automatic system AMH.
The expanded uncertainty of the pressure measured by the balance in the conditions of calibration at LNE is:

$$
U(\mathrm{p})_{L N E}=1,0 \mathrm{~Pa}+1,01^{-5} \mathrm{xp}
$$

The standard uncertainty of the deviation was calculated combining the uncertainty of the reference pressure, the repeatability between the deviations observed in cycles 1 to 3, and the resolution of the transfer standard.

## 4. Transfer Standard

### 4.1 Identification

The transfer standard is a pressure monitor RPM4 A7M, serial No. 684, operating with nitrogen. It has a resolution of 1 Pa . The manufacturer is DHInstruments, Inc.
The transfer standard was carried by hand by

### 4.2 Operating principle

The manometer is composed of an absolute Quartz Reference Pressure Transducer (Q-RPT) and of an internal barometer.

Figure 1: RPM4 pneumatic schematics
The gauge pressure indicated by the RPM4 at the instant $t$, PRPM ( $t$ ), is expressed by the following equation:

$$
\begin{equation*}
\operatorname{PRPM}(t)=\mathrm{PQ}_{\mathrm{Q}}(\mathrm{t})-\mathrm{PQ}_{\mathrm{Q}}(0)+\mathrm{P}_{\text {baro }}(\mathrm{t})-\mathrm{P}_{\text {baro }}(0) \tag{1}
\end{equation*}
$$

with the following expressions:
$P_{Q}(t): \quad$ Indication of the Q-RPT absolute pressure at the instant $t$
$P_{Q}(0)$ : Indication of the Q-RPT at the atmospheric pressure at the time of zeroing execution
$P_{\text {baro }}(0)$ : Indication of the barometer at the atmospheric pressure, at the time of zeroing execution
$P_{\text {baro }}(\mathrm{t})$ : Indication of the barometer at the atmospheric pressure, at the instant $t$.

## 5. Calibration procedure

The calibration of the transfer standard had to be performed after a warm-up time of at least twelve hours in an air conditioned room at $20^{\circ} \mathrm{C}$. It was asked to perform eleven pressure points in an ascending and then descending sequence, repeated three times, at the following nominal gauge pressures: $0 \mathrm{hP} ; 0,7 \mathrm{MPa} ; 1,4 \mathrm{MPa} ; 2,1 \mathrm{MPa} ; 2,8 \mathrm{MPa} ; 3,5 \mathrm{MPa} ; 4,2 \mathrm{MPa} ; 4,9 \mathrm{MPa} ; 5,6 \mathrm{MPa}$; $6,3 \mathrm{MPa} ; 7 \mathrm{MPa}$ of nitrogen. The stabilisation time at each pressure point was one minute and the recording time of the transfer standard readings at each pressure level thirty seconds.

The one cycle procedure is described below:

- Zeroing of the pressure module by running the "AutoZero" function of the transfer standard after connecting together the TEST(+) port with the TEST(-) port
- Feeding the transfer standard from the reference standard at the successive pressure levels up to 7 MPa , avoiding to come back to zero pressure between the points
- Applying a stabilisation time of five minutes at 7 MPa , then feeding the transfer standard from the reference standard at the successive pressure levels down to zero pressure
- Applying a stabilisation time of five minutes at zero prior to a new zeroing of the pressure module and the beginning of another cycle.

## 6. Transfer standard stability

The transfer standard was calibrated 2 times at LNE: 03 Sept. 2014 and 30 Sept. 2014. Figure 2 shows the stability of the transfer standard as observed at LNE during this period. A small drift can be
identified. The standard uncertainty due to the stability of the transfer standard is estimated from the relative difference of the calibration slopes between the two calibrations at LNE :

$$
\begin{equation*}
u_{\text {stab }}=\frac{\mid \text { Slope }_{L N E \text { end }}-\text { Slope }_{\text {LNE begin }} \mid}{\sqrt{3}} \times \frac{n_{\text {Kim-Lipi }}}{n_{L N E i}}=5,7.10^{-6} . \mathrm{p} \tag{2}
\end{equation*}
$$

Where ntab represents the number of days separating two calibrations in a laboratory. From their side, KIM-LiPI observed a drift of 4 ppm between the two calibrations.

Figure 2. Stability of the transfer standard as observed at LNE. Difference between the two calibrations.

## 7. Results

The mean deviations ( $\mathrm{Dp}, \mathrm{i}$ ) measured by the participants corrected from zero and their standard uncertainties $u$ (Dlab) are presented in Table 7 and figure 3. For both laboratories, the average from the two calibrations is considered.
The standard uncertainties u (Dlab) are calculated using the equation:

$$
\begin{equation*}
u\left(D_{L a b}\right)=\sqrt{\frac{u_{L A B 1}^{2}}{4}+\frac{u_{L A B E 2}{ }^{2}}{4}+\frac{1}{2} \rho *\left(u_{L A B 1} \times u_{L A B 2}\right)} \tag{3}
\end{equation*}
$$

A correlation coefficient $\rho=0,8$ is considered between the two calibrations.

Table 7. Mean deviations $\left(D_{p, i}\right)$ measured by the participants and their standard uncertainties.

Figure 3. Mean deviations ( $D_{p, i}$ ) measured by the participants.

Bilateral comparison in the gauge pressure range of $0,7 \mathrm{MPa}$ to 7 MPa .

## 8. Reference values

The deviations from LNE (D.LNE) are considered as the reference values. Their standard uncertainties are calculated using the equation:

$$
\begin{equation*}
u\left(D_{p r e f}\right)=\sqrt{\frac{u_{L N E 1}{ }^{2}}{4}+\frac{u_{L N E 2}{ }^{2}}{4}+\frac{1}{2} \rho^{*}\left(u_{L N E 1} \times u_{L N E 2}\right)+u_{s t a b}^{2}} \tag{4}
\end{equation*}
$$

A correlation coefficient $\rho=0,8$ is considered between the two calibrations at LNE.

## 9. Deviation from the reference values, degrees of equivalence

The deviation of KIM-LIPI from the reference values $\delta_{\rho, ~}=\left(D_{\text {KIM-LiPI }}-D_{\text {REF }}\right)$ and their expanded uncertainties $U\left(\delta_{p},\right)$ are given table $9 . U\left(\delta_{p}\right)$ is calculated as the combination of the uncertainty of the reference value and the uncertainty of KIM-LIPI deviation:

$$
\begin{equation*}
\left.U\left(\delta_{p,}\right)=2 \sqrt{u^{2}\left(D_{p r e f}\right)+u^{2}\left(D_{K I M-L P I}\right)}\right] \tag{5}
\end{equation*}
$$

The degrees of equivalence $E_{n}$ are quantified by :

$$
\begin{equation*}
E_{n}=\delta_{p} / U\left(\delta_{p}\right) \tag{6}
\end{equation*}
$$

Table 9. Differences of the deviations of KIM-LIPI to the reference values $\delta_{\rho}$ for each pressure, their expanded uncertainties $U\left(\delta_{p}\right)$ and the degrees of equivalence $E_{n}$

## 10. Conclusion

The results of the comparison can be considered as satisfactory. All the values reported by KIM-LIPI agree with the reference values within the expanded uncertainties with a coverage factor $k=2$. The degrees of equivalence between both laboratories are always less than 1 , and in more than half of the cases less than 0,1 .
The standard deviation of the deviations of KIM-LIPI from the reference values is less than 17 Pa , representing $2,4 \times 10^{-6}$ of the pressure range.
